

A *NEW* Direction for Subglottic Secretion Management

The **SIMEX** Subglottic Aspiration System, available as *cuff M* and *cuff S*, is the most advanced solution for the aspiration of subglottic secretions, and features the all new, state of the art, *automated intermittent* mode of therapy.

“Using syringe or other conventional suction sources for SSD proved impractical and ineffective in our institution. An 8-month trial of 10 patients using the SIMEX automated subglottic aspiration system resulted in significant increases in volumes of secretions collected, significant decreases in maceration and soiling, and there were no incidents of VAE or VAC.”
